1. **Max flow and duality (5 pts.)**

1. The Corresponding primal model of the problem is as follows:

$$
\begin{aligned}
\max \quad & x_{CF} + x_{DF} + x_{EF} \\
& x_{AB} - x_{BE} - x_{BC} = 0 \quad \mathbf{u_1} \\
& x_{BC} + x_{DC} - x_{CF} = 0 \quad \mathbf{u_2} \\
& x_{AD} - x_{DC} - x_{DF} - x_{DE} = 0 \quad \mathbf{u_3} \\
& x_{AE} + x_{BE} + x_{DE} - x_{EF} = 0 \quad \mathbf{u_4} \\
& x_{AB} \le 5 \quad \mathbf{v_1} \\
& x_{AD} \le 4 \quad \mathbf{v_2} \\
& x_{AE} \le 3 \quad \mathbf{v_3} \\
& x_{BE} \le 1 \quad \mathbf{v_4} \\
& x_{DE} \le 3 \quad \mathbf{v_5} \\
& x_{BC} \le 3 \quad \mathbf{v_6} \\
& x_{DC} \le 3 \quad \mathbf{v_7} \\
& x_{DF} \le 3 \quad \mathbf{v_8} \\
& x_{EF} \le 8 \quad \mathbf{v_9} \\
& x_{CF} \le 5 \quad \mathbf{v_{10}} \\
& x_{AB}, x_{AD}, x_{AE}, x_{BE}, x_{DE}, x_{BC}, x_{DC}, x_{DF}, x_{EF}, x_{CF} \ge 0
\end{aligned}
\tag{1}
$$

2. Dual problem:

$$
\begin{aligned}
\min \quad & 5v_1 + 4v_2 + 3v_3 + v_4 + 3v_5 + 3v_6 + 3v_7 + 3v_8 + 8v_9 + 5v_{10} \\
& u_1 + v_1 \ge 0 \quad \mathbf{x_{AB}} \\
& u_3 + v_2 \ge 0 \quad \mathbf{x_{AD}} \\
& u_4 + v_3 \ge 0 \quad \mathbf{x_{AE}} \\
& -u_1 + u_2 + v_6 \ge 0 \quad \mathbf{x_{BC}} \\
& -u_3 + u_4 + v_5 \ge 0 \quad \mathbf{x_{DE}} \\
& -u_1 + u_4 + v_4 \ge 0 \quad \mathbf{x_{BE}} \\
& u_2 - u_3 + v_7 \ge 0 \quad \mathbf{x_{DC}} \\
& -u_3 + v_8 \ge 1 \quad \mathbf{x_{DF}} \\
& -u_4 + v_9 \ge 1 \quad \mathbf{x_{EF}} \\
& -u_2 + v_{10} \ge 1 \quad \mathbf{x_{CF}} \\
& v_1, v_2, v_3, v_4, v_5, v_6, v_7, v_8, v_9, v_{10} \ge 0 \\
& u_1, u_2, u_3, u_4 \text{ unrestricted.}
\end{aligned}
\tag{2}
$$

3. An AMPL model that solves the max-flow problem 1 and the output is the following:

```
var x_AB >=0;
var x_AD >=0;
var x_AE >=0;
var x_BE >=0;

For the dual solutions from the primal problem (max-flow) formulation, we have

$$(u_1, u_2, u_3, u_4, v_1, v_2, v_3, v_4, v_5, v_6, v_7, v_8, v_9, v_{10}) = (0, -1, -1, -1, 0, 1, 1, 1, 0, 1, 0, 0, 0, 0)$$

For the (primal) solutions of the dual formulation in (2), we again have

$$(u_1, u_2, u_3, u_4, v_1, v_2, v_3, v_4, v_5, v_6, v_7, v_8, v_9, v_{10}) = (0, -1, -1, -1, 0, 1, 1, 1, 0, 1, 0, 0, 0, 0)$$

so they exactly coincide.

For the primal solution of the primal formulation (max-flow), we have

$$(x_{AB}, x_{AD}, x_{AE}, x_{BD}, x_{DE}, x_{BC}, x_{DC}, x_{DF}, x_{EF}, x_{CF}) = (4, 4, 3, 1, 3, 3, 0, 1, 7, 3)$$

For the dual solution of the dual formulation in (2), we have

$$(x_{AB}, x_{AD}, x_{AE}, x_{BD}, x_{DE}, x_{BC}, x_{DC}, x_{DF}, x_{EF}, x_{CF}) = (4, 4, 3, 3, 3, 1, 1, 0, 7, 4)$$

We see that the solutions are different, which are, of course, both optimal. This shows that the max-flow problem can have more than one optimal solution.

4. The optimal solution of the min-cut is obtained as follows: In the dual optimal solution for the max-flow problem, examine the non-zero dual variables which correspond to the bound constraints. Above the only nonzero dual variables are $(v_2, v_3, v_4, v_6) = (1, 1, 1, 1)$ and these dual variables correspond to the bound constraints $x_{AD} \leq 4$, $x_{AE} \leq 3$, $x_{BE} \leq 1$ and $x_{BC} \leq 3$ respectively. We conclude that we obtain a min-cut when we remove the arcs (or edges) x_{AD}, x_{AE}, x_{BE} and x_{BC}.

5. Notice that in the max-flow problem, the flow which exits the source node A must be equal to the flow which enters the sink node F. So we can always solve a max-flow problem by maximizing the either objective, in this case $x_{CF} + x_{DF} + x_{EF}$ or $x_{AB} + x_{AD} + x_{AE}$. When we use the objective $x_{AB} + x_{AD} + x_{AE}$, the new dual problem becomes the following:

$$
\begin{aligned}
\min \quad & 5v_1 + 4v_2 + 3v_3 + v_4 + 3v_5 + 3v_6 + 3v_7 + 3v_8 + 8v_9 + 5v_{10} \\
& u_1 + v_1 \geq 1 \quad \mathbf{x_{AB}} \\
& u_3 + v_2 \geq 1 \quad \mathbf{x_{AD}} \\
& u_4 + v_3 \geq 1 \quad \mathbf{x_{AE}} \\
& -u_1 + u_2 + v_6 \geq 0 \quad \mathbf{x_{BC}} \\
& -u_3 + u_4 + v_5 \geq 0 \quad \mathbf{x_{DE}} \\
& -u_1 + u_4 + v_4 \geq 0 \quad \mathbf{x_{BE}} \\
& u_2 - u_3 + v_7 \geq 0 \quad \mathbf{x_{DC}} \\
& -u_3 + v_8 \geq 0 \quad \mathbf{x_{DF}} \\
& -u_4 + v_9 \geq 0 \quad \mathbf{x_{EF}} \\
& -u_2 + v_{10} \geq 0 \quad \mathbf{x_{CF}} \\
& v_1, v_2, v_3, v_4, v_5, v_6, v_7, v_8, v_9, v_{10} \geq 0 \\
& u_1, u_2, u_3, u_4 \text{ unrestricted.}
\end{aligned}
\tag{3}
$$

The relation between the dual problems (2) and (3) is more tricky. We need to show that by solving the dual problems (2) or (3), we get the same objective values. Suppose that $(u_1, u_2, u_3, u_4, v_1, v_2, v_3, v_4, v_5, v_6, v_7, v_8, v_9, v_{10})$ is an optimal solution for (2). Then it is a routine check to verify that $(u_1 - 1, u_2 - 1, u_3 - 1, u_4 - 1, v_1, v_2, v_3, v_4, v_5, v_6, v_7, v_8, v_9, v_{10})$ satisfies the constraints in the system (3) (check this yourself). Note also that since the objective functions in (2) and (3) only involve the variables $v's$ and since the solutions for $(u_1, u_2, u_3, u_4, v_1, v_2, \cdots, v_{10})$ and $(u_1 - 1, u_2 - 1, u_3 - 1, u_4 - 1, v_1, v_2, \cdots, v_{10})$ have exactly the same $v's$, the objective values in (2) and (3) will be the same. Similarly it is easy to see that when (3) has an optimal solution $(u_1, u_2, u_3, u_4, v_1, v_2, \cdots, v_{10})$, then $(u_1 + 1, u_2 + 1, u_3 + 1, u_4 + 1, v_1, v_2, \cdots, v_{10})$ is a solution for (2) with the same objective value. This argument shows that by solving (2) or (3), we obtain the same objective values.

2. Shortest path and duality (5 pts.)

1. The Corresponding primal model of the problem is as follows:

$$
\begin{aligned}
\min \quad & 3x_{AB} + 10x_{AD} + 4x_{AE} + 4x_{BC} + 4x_{BD} + 4x_{ED} + 2x_{EF} + 5x_{DC} + x_{DG} + x_{DF} + 5x_{CG} + 10x_{GF} \\
& +3x_{BA} + 10x_{DA} + 4x_{EA} + 4x_{CB} + 4x_{DB} + 4x_{DE} + 2x_{FE} + 5x_{CD} + x_{GD} + x_{FD} + 5x_{GC} + 10x_{FG}
\end{aligned}
$$

$$
\begin{array}{ll}
x_{AB} + x_{AD} + x_{AE} - x_{BA} - x_{DA} - x_{EA} = 1 & \mathbf{u_1} \\
x_{BA} + x_{BD} + x_{BC} - x_{AB} - x_{DB} - x_{CB} = 0 & \mathbf{u_2} \\
x_{CB} + x_{CD} + x_{CG} - x_{BC} - x_{DC} - x_{GC} = 0 & \mathbf{u_3} \\
x_{DA} + x_{DB} + x_{DC} + x_{DE} + x_{DF} + x_{DG} - x_{AD} - x_{BD} - x_{CD} - x_{ED} - x_{FD} - x_{GD} = 0 & \mathbf{u_4} \\
x_{EA} + x_{ED} + x_{EF} - x_{AE} - x_{DE} - x_{FE} = 0 & \mathbf{u_5} \\
x_{FE} + x_{FD} + x_{FG} - x_{EF} - x_{DF} - x_{GF} = 0 & \mathbf{u_6} \\
x_{GC} + x_{GD} + x_{GF} - x_{CG} - x_{DG} - x_{FG} = -1 & \mathbf{u_7} \\
x_{AB}, x_{AD}, x_{AE}, x_{BC}, x_{BD}, x_{DC}, x_{DG}, x_{DF}, x_{EF}, x_{CG}, x_{FG} \geq 0, \\
x_{BA}, x_{DA}, x_{EA}, x_{CB}, x_{DB}, x_{CD}, x_{GD}, x_{FD}, x_{FE}, x_{GC}, x_{GF} \geq 0.
\end{array}
$$

$$(4)$$

2. Dual problem:

$$
\begin{aligned}
\max \quad & u_1 - u_7 \\
u_1 - u_2 &\leq 3 \quad \mathbf{x_{AB}} \\

```

4. The only nonzero primal variables are x_{AB}, x_{BD} and x_{DG}, so we need just check the complementary slackness for these primal variables and their corresponding dual constraints as the following,

$$x_{AB}(u_1 - u_2 - 3) = 0,$$
$$x_{BD}(u_2 - u_4 - 4) = 0,$$
$$x_{DG}(u_4 - u_7 - 1) = 0.$$

clearly, by using the value of dual variables $u_1 = 7$, $u_2 = 4$, $u_4 = 0$ and $u_7 = -1$, we can see that above equalities are satisfied.

5. The first solution of shortest path which is obtained by solving the primal model is $A \to B \to D \to G$ or equivalently $x_{AB} = x_{BD} = x_{DG} = 1$. In order to find the second solution we can add a new constraint $x_{AB} + x_{BD} + x_{DG} < 3$, in this way we are enforcing our model to find another optimal solution(if there is any).

Note: If the problem has a unique solution, by adding this new constraint, since we are blocking the only optimal solution we can not get the that anymore.

3. **Complementary slackness and duality (7 pts.)**

1)Unique primal-dual solutions

a) A feasible solution can be simply found as we have only two functional constraints. For instance, $x = (0, 1, 0, 0)^T$ with objective $z_{primal} = 3$ can be mentioned.

□

b) Let u_1 and u_2 be the dual variable for the first and second constraint, respectively. Then, the dual problem can be represented as

$$\max u_2$$
$$\text{s.t.}$$
$$u_1 + u_2 \geq 1$$
$$u_1 + u_2 \leq 3$$
$$u_1 - u_2 \leq 1$$
$$u_1 - u_2 \geq -1$$
$$u_1, u_2 \geq 0$$

c) A feasible solution to the dual problem would be $u = (1,1)^T$ with $z_{dual} = 1$. Recall from Weak Duality that when the primal is a minimization-type problem, a feasible solution to its associated dual gives a lower bound for the optimal primal objective value. This simple example also supports this fact as $z_{dual} = 1 \leq z_{primal} = 3$.   □

d) As the feasible region lives in a 2-dimensional space, we can simply draw the feasible region and objective contours to find the optimum solution. Doing so, the optimum solution would be $u = (1,2)^T$ with $z_{opt} = 2$.   □

e) As $u = (1,2)^T$ is the dual optimal solution, it satisfies the complementary conditions as follows

$$\begin{cases} u_1(x_1 + x_2 + x_3 + x_4) = 0 \\ u_2(x_1 + x_2 - x_3 - x_4 - 1) = 0 \end{cases} \tag{6}$$

Since $u_1, u_2 > 0$, we would have :

$$u_1(x_1 + x_2 + x_3 + x_4) = 0 \quad \Rightarrow \quad x_1 + x_2 + x_3 + x_4 = 0$$
$$u_2(x_1 + x_2 - x_3 - x_4 - 1) = 0 \quad \Rightarrow \quad x_1 + x_2 - x_3 - x_4 = 1$$

On the other hand, the remaining the complementary conditions as follows:

$$\begin{cases} x_1(u_1 + u_2 - 1) = 0 \\ x_2(u_1 + u_2 - 3) = 0 \\ x_3(u_1 - u_2 - 1) = 0 \\ x_4(u_1 - u_2 + 1) = 0 \end{cases} \tag{7}$$

Since $u = (1,2)$, we would have some dual constraints binding and some are not.

$$x_1(u_1 + u_2 - 1) = 0 \quad \Rightarrow \quad x_1 = 0$$
$$x_3(u_1 - u_2 - 1) = 0 \quad \Rightarrow \quad x_3 = 0$$

Notice that the information for the remaining dual constraints would not be helpful (ie, they do not give us information about primal problem decision variables), as they already satisfy the complementary conditions.

Now, based on the information given so far, overall we have:

$$\begin{cases} x_1 = 0 \\ x_3 = 0 \\ x_1 + x_2 + x_3 + x_4 = 0 \\ x_1 + x_2 - x_3 - x_4 = 1 \end{cases} \tag{8}$$

Hence, from this set of equations, we have $x = (0, 0.5, 0, -0.5)$. Therefore, we found the optimal decision variable values for primal problem: $x = (0, 0.5, 0, -0.5)$.

□

2) Multiple primal solutions

a) In this case, the dual problem will change to

$$\max \ - u_2$$
$$\text{s.t.}$$
$$u_1 + u_2 \geq 1$$
$$u_1 + u_2 \leq 3$$
$$u_1 - u_2 \leq 1$$
$$u_1 - u_2 \geq -1$$
$$u_1, u_2 \geq 0$$

In fact, only the dual objective function is affected. □

b) As the feasible region is the same as in part (1-b), we only need to evaluate the three feasible corners to find the maximum objective value. Doing so, we end up with $u = (1, 0)^T$ as the optimum solution.
□

c) By the complementary conditions, we would get
As $u = (1, 0)^T$ is the dual optimal solution, it satisfies the complementary conditions as follows

$$\begin{cases} u_1(x_1 + x_2 + x_3 + x_4) = 0 \\ u_2(x_1 + x_2 - x_3 - x_4 + 1) = 0 \end{cases} \tag{9}$$

Since $u_1 > 0$, we would have :

$$u_1(x_1 + x_2 + x_3 + x_4) = 0 \quad \Rightarrow \quad x_1 + x_2 + x_3 + x_4 = 0$$

On the other hand, the remaining the complementary conditions as follows:

$$\begin{cases} x_1(u_1 + u_2 - 1) = 0 \\ x_2(u_1 + u_2 - 3) = 0 \\ x_3(u_1 - u_2 - 1) = 0 \\ x_4(u_1 - u_2 + 1) = 0 \end{cases} \tag{10}$$

13

Since $u = (1, 0)$, we would have some dual constraints binding and some are not.

$$x_2(u_1 + u_2 - 3) = 0 \quad \Rightarrow \quad x_2 = 0$$
$$x_4(u_1 - u_2 + 1) = 0 \quad \Rightarrow \quad x_4 = 0$$

Notice that the information for the remaining dual constraints would not be helpful (ie, they do not give us information about primal problem decision variables), as they already satisfy the complementary conditions.

Now, based on the information given so far, overall we have:

$$\left\{ \begin{array}{l} x_2 = 0 \\ x_4 = 0 \\ x_1 + x_2 + x_3 + x_4 = 0 \end{array} \right. \tag{11}$$

Hence, from this set of equations, we have infinitely many solutions for primal problem. Thus, the optimal set for primal decision variables is

$$S = \{(x_1, x_2, x_3, x_4) | x_1 = -x_3, x_2 = 0, x_4 = 0, x_1 \leq 0, x_3 \geq 0\}$$

□

4. **Linear Programming (3 pts.)**

Note: We assume that $a_i \geq 0$ and $c_i \geq 0$ for all i=1,...,n.

The dual associated with this problem is formulated as

$$\max \; by$$
$$\text{s.t.}$$
$$a_i y \leq c_i \quad i = 1, ..., n$$
$$y \geq 0$$

Let $r = arg\min_i \dfrac{c_i}{a_i}$. This dual problem can be rewritten as follows

$$\max \; by$$
$$\text{s.t.}$$
$$y \leq \dfrac{c_r}{a_r}$$
$$y \geq 0$$

It shows that $y^* = \dfrac{c_r}{a_r}$ and the optimal value of the objective function is $\dfrac{bc_r}{a_r}$.

Now, by the complementary conditions, we would get

$$y(b - a_1 x_1 - a_2 x_2 - ... - a_n x_n) = 0 \tag{12}$$

Since $y^* \neq 0$, 12 follows that

$$b - a_1 x_1 - a_2 x_2 - \ldots - a_n x_n = 0 \Rightarrow a_1 x_1 + a_2 x_2 + \ldots + a_n x_n = b$$

Hence, the primal problem can be rewritten as follows

$$\min c_1 a_1 + c_2 a_2 + \ldots + c_n a_n$$
$$\text{s.t. } a_1 x_1 + a_2 x_2 + \ldots + a_n x_n = b$$
$$y \geq 0$$

Let $r = arg \min_i \dfrac{c_i}{a_i}$. It can be simply seen that the optimal solution for the primal problem is

$$x_i^* = \begin{cases} \dfrac{b}{a_r} & \text{if } i = r \\ 0 & \text{if } i \neq r \end{cases}$$

and the optimal value of the objective function is $\dfrac{bc_r}{a_r}$ which is equal to the optimal objective function of the dual problem and it verifies its optimality.
